Software Engineering

November 14, 2014

Raj Patel, Jessica Lin, Landon Gray

This week worked on fixing our server login issues. Spent several hours fixing mysql on one of the team computers after updating Yosemite. Scheduled meeting times for the weekend together to get more work done on the backend. Added auto complete search functionality to our front end design in order for Karen to be able to type part of a crn and have the system predict which class section she was looking for. This feature should save her time when looking up class sections.

We still need to still fully implement our cucumber tests in ruby. We also still need to decide how conflicts are going to display on the screen.
